## **The Chemicals of Love, H<sub>2</sub>O to Nuclear Reaction**

It's not surprising that people can date for seven years and break up or be married for twenty years with children and still have a divorce. The problem is not love, it's a simple case of misunderstanding nature. Flesh of my flesh and bone of my bone is not just a romantic statement but is a statement of chemical proportions. Hold on. In nature there are different substances made from different elements. We have pure elements, chemical substances, chemical compounds and of course mixtures.

The most natural and highest level of relationships have chemical affinity. This is when two elements join together such that the two lose their own properties to form a completely new substance altogether. These elements have a natural attraction such that their very basic atoms are attracted to each other. Let's call this level, the Adam and Eve level, because at this stage there is no such thing as dating being required, it is the most natural level. Some people are privileged enough to know this and wait for this moment in time when they can meet their element who is also attracted them. Unfortunately this level is not very common, forming only 7-8 percent of marriages in the whole world.

Some elements on the other hand have no natural affinity and require such intense heat and pressure to combine. In other words these need so much effort and work; hence the term let us work it out in most relationships. Normally they have no attraction between them or the attraction is weak but out of desire to be bonded to something they subject themselves to very high pressures and heat or cold. Sometimes such chemicals can be highly unstable and volatile. Such relationships contain many compromises on both sides. The relationships can work but needs more effort. Let's call this level the Jacob and Leah level. These relationships eventually have an attraction between the participating elements but it is never the real reason why they got together there is always another reason bigger than love. Well these are the majority of marriages so let's give them a seventy percent existence.

Now on the lowest level are the mixtures. These are funny relationship but are very common also. Sometimes they result in marriage, staying together, dating and all that stuff. A mixture is a substance where there is no real chemical bond but just a getting together. The funniest things about mixtures are that they have no real proportions. Sometimes one substance increase more than the other at any time. Mixtures are easy to separate and see because you can still recognize their different elements. It's like a sugar and water solution. When you mix water and sugar it looks like the sugar has disappeared but all you need to do is taste the solution and you can taste the sugar or water. They are two people who are together but are not one, they still possess their individualities. Mixtures obviously are a waste of time but anyway this is why we date, to mix and mingle and experiment to see if there is any affinity but we never really give of ourselves.

Three people asked me yesterday why they can never have a stable relationship well here is the answer, "the chemistry of love." If you are in a relationship or marriage, if you really look hard enough (be honest at least) you will see that you fit into any three of these categories. If you are dating and you discover that you are not in 7-8 percent or that your relationship does not fit into the natural affinity level, here is my advice, THINK. If you are having second thoughts and you realize you are not in affinity, THINK. If you discover that you have to put a lot of work into this dating relationship its simple, THINK. If you notice that he or she has a tendency to slide away once there is a little cooling or heat I suggest you THINK.

Now if you are already married and you believe that your marriage is not based on the 7-8 percent level I suggest that you read on.

## Chemicals of Love Part 2

The type of chemical bond that occurs between elements determines the type of chemical compound which is going to be produced. Each element or rather each atom must either be prepared to share, give or receive electrons in order for there to be a new compound formed. So when elements come together they form a partnership which has mutual benefit and coexistence to form something that appears so different.

The marriage equation is defined as one plus one equals one, which is the same thing chemically, because when you bring two elements together like Hydrogen and Oxygen you get H<sub>2</sub>O which is water, a new substance which looks completely different from the individualistic elements. Now when two people get together they can form different types of bonds, which for the sake of this article space let us deal with covalent and ionic bonds. In a covalent bond the two individuals share their electrons. In other words if I had patience in me as a possession and you had courage, my patience is still in me but becomes part of you and your courage is still in you but becomes part of me. When the two come together a person who never had courage is able to stand in courage because their partner in the chemical bond has courage also.

On the other hand there is the ionic bond where one element must be willing to give its electron to another so that there can be a partnership by attraction. Simply put one element has a need which the other element can provide. So the element that has need receives an electron (s) and the other one gives of its own. The two become bonded together. Ever heard of the damsel in distress who gets rescued by the knight?

Why do people who get married suddenly discover that they are not compatible? Ionic and Covalent bonds are examples of strong chemical bonds. They are strong because there is elementary electron sharing, giving and receiving. The result is a mutual bond. On the other hand weak chemical bonds occur between molecules which already have a bond with something

else forming another bond with other elements. It is like a person who is in love with their ex-girlfriend getting married to another woman, or a person who worships her business getting married to someone who has no interest in the business at all. The result is just a mixture of people attracted together but whose chemical bond is very weak.

Whether we like it or not attraction is very important in a relationship, it defines how things are going to go. Attraction must thus be at the different levels, physically and spiritually. When two elements form a strong bond they form partnership to fulfill a purpose full of certain characteristics. This is why for example it does not say that Adam got a wife but it first says he got a partner, who was flesh of his flesh and bone off his bone. She was a helpmate which denotes strong intent to fulfill the same purpose in life. If two elements bond together but try to achieve their own different individualistic motives the result is divorce and it will happen.

The best advice I can give on chemicals of love is that if you are not yet a complete individual with a complete personality do not get married, THINK. If you are not developed in character and you get married then all of a sudden you start finding your own character you might just discover that the person you are sleeping with is a stranger to you, in such cases you will have lots of work to do to keep that marriage. If you marry a person who is not yet fully grown in terms of personality and knowing what they want you are going to have a lot of work keeping that marriage going. Chemical bonds are created from elements which have their own properties and are willing to share, receive and give of their own in order to become a new stronger compound. They are not made from elements which are just trying to find their own personalities by joining someone else. The moment you try to find your own self by combining with another person it is not going to be pretty.

There is a need at this time to define the difference between marrying someone because you are attracted to them with a need and marrying someone because you are trying to find your own character.
